

CRF tables

The enclosed CRF tables correspond to the French emissions inventory to be submitted for 2004. They cover all substances required by the UNFCCC. They refer both to mainland France (so called “Métropole”) and overseas areas.

Please note that:

- Methodological changes have been made since 1990. The corresponding explanation and recalculation tables are provided.
- Moreover, additional information concerning CO₂ emissions from international air traffic are provided: contributions from intra-European Union flights and other international flights.

The complete report will be transmitted at a later date.

These data cancel and replace all other previous versions relating to the same scope (sources, substances, geographical coverage ...).
