European Environment Agency

Bathing water quality in the season of 2020 **Slovakia**

Under the provisions of the <u>Bathing Water Directive</u>, more than 22 000 bathing waters are monitored in Europe each season. The monitoring data and other information regarding bathing water management are reported to the European Environment Agency by 30 reporting countries in Europe, to be assessed for the annual European report and more detailed national reports.

1. BWD reporting in the season of 2020

Bathing waters in the season 2020						
Total reported	32					
Coastal	0					
Inland	32					
First identified in 2020	0					
Delisted in 2020	0					
Total reported samples	157					

Bathing water quality in the season of 2020

Excellent	18 (56.3%)
Good	7 (21.9%)
Sufficient	3 (9.4%)
Poor	0 (0%)
Not classified	4 (12.5%)

The bathing waters are quality classified according to the two microbiological parameters (Escherichia coli and intestinal enterococci) defined in the Bathing Water Directive. 87.5% of all reported bathing waters (includes those that could not be quality classified due to lack of samples) are in line with the minimum quality standards of the Directive, thus classified "sufficient" or better.

2. BWD monitoring

Each bathing water that is identified by the reporting country needs to have a monitoring calendar established before the bathing season. The monitoring calendar requirements can be summarised as follows: (1) a preseason sample is to be taken shortly before the start of each bathing season; (2) no fewer than four (alternatively, three for specific cases) samples are to be taken and analysed per bathing season; and (3) an interval between sampling dates never exceeds one month.

From the reported data, the assessment also designates effective implementation of the monitoring calendar (Table 1).

Table 1: Bathing waters in 2020 according to implementation of the monitoring calendar

	Count	Share of total [%]
Monitoring calendar implemented A bathing water satisfies monitoring calendar conditions listed above.	29	90.60%
Monitoring calendar not implemented A bathing water does not satisfy monitoring calendar conditions listed above. It may be quality-classified if enough samples are available in the last assessment period.	3	9.40%

In addition to the monitoring calendar, management specifics of the last assessment period of four years are also assessed. The status primarily indicates whether the complete dataset of four seasons is available, but also points out the reasons as to why the bathing waters do not have the complete last assessment period dataset. The latter may indicate developing conditions at the site – most importantly, whether the bathing water has been newly identified within the period, or any changes have occurred that are likely to affect the classification of the bathing water.

Table 2: Management specifics in the last assessment period of 2017–2020

	Count	Share of total [%]
Continuously monitored A bathing water has been monitored in each bathing season in the last assessment period.	28	87.50%
Newly identified A bathing water was identified for the first time within the last assessment period. Such status is assigned for full four years after reported.	0	0%
Quality changes A bathing water was subject to changes described in BWD Art. 4.4 within the last assessment period. Such status is assigned for full four years after reported.	0	0%
Monitoring gap A bathing water was not monitored for at least one season in the last assessment period. No quality classification is made if not enough samples are reported for the most recent season.	4	12.50%

3. Bathing water quality

3.1 Inland bathing waters

Inland bathing waters are situated at rivers and lakes, featuring fresh water and with respective parameter thresholds defined in Annex I of the Directive. Quality trend for the period 2004–2020 is shown in Figure 1. Number of bathing waters by quality class for the last assessment period 2017–2020 is given in Annex I.

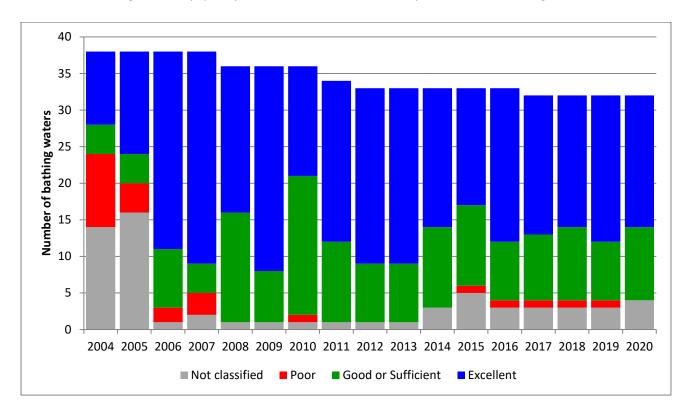

Figure 1: Trend of inland bathing water quality. Notes: Each column represents an absolute number of bathing waters in the season. Quality classes "good" and "sufficient" are merged for comparability with the classification of the preceding Bathing Water Directive 76/160/EEC.

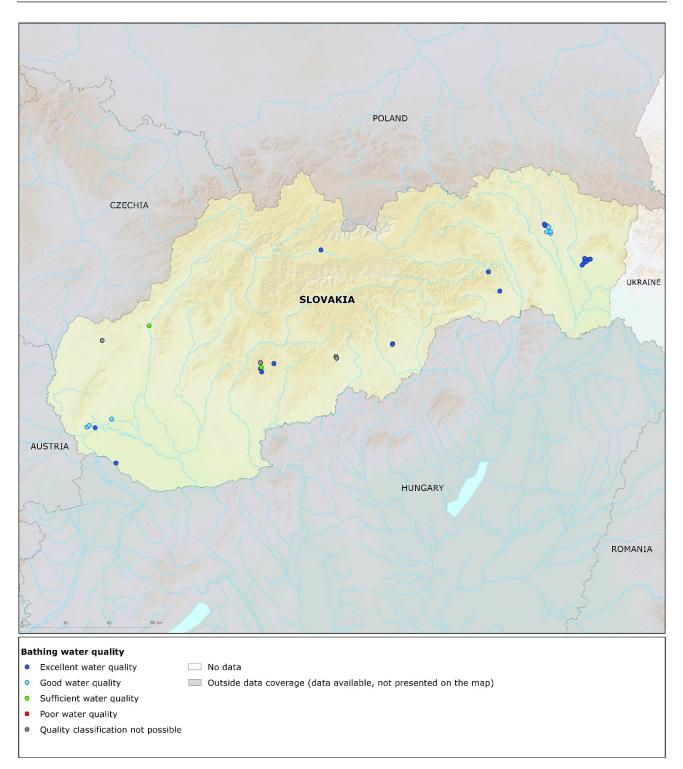

Annex I Bathing water quality in 2017–2020

		Total	EXecution		llent	Good		Sufficient		Poor		Not classified	
	number of bathing waters		Count	%	Count	%	Count	%	Count	%	Count	%	
Total	2017	32	19	59.4%	9	28.1%	0	0.0%	1	3.1%	3	9.4%	
	2018	32	18	56.3%	9	28.1%	1	3.1%	1	3.1%	3	9.4%	
	2019	32	20	62.5%	7	21.9%	1	3.1%	1	3.1%	3	9.4%	
	2020	32	18	56.3%	7	21.9%	3	9.4%	0	0.0%	4	12.5%
